

Supplify

Investor Product & Business Guide

A connected operating system for restaurant procurement and supplier fulfillment

Audited against the current Supplify ERP, Android, and iOS repositories

Version 1.0 · 26 September 2026

This document distinguishes implemented product capability, configuration-dependent services, partial workflows, and future opportunity. It is a product and business overview, not audited financial advice, a market-size study, or a promise of future performance.

Document control

Item	Value
Audience	Investors, strategic partners, executives, and diligence teams
Evidence	Current application code, migrations, tests, plans, navigation, services, and operating documentation
Product status vocabulary	Active; Active/configuration-dependent; Partial; Web-first; Retired; Future opportunity
Pricing basis	Current seeded subscription matrix; excludes tax, negotiated enterprise terms, and provider fees
Not included	Independently validated TAM, traction, revenue, customer count, or unit-economics claims

Contents

14. Audited capability appendix

1. Executive summary

Supplify is a multi-tenant B2B marketplace and operational ERP connecting restaurants, supplier organizations, warehouses, and delivery drivers in one transaction network. It begins where restaurants feel daily friction—finding products, comparing effective prices, ordering, receiving, controlling inventory, and reconciling invoices—and extends into the supplier's execution layer: catalog, customer pricing, warehouse inventory, picking, routes, drivers, proof, receivables, promotion, and demand intelligence.

The codebase demonstrates a broad implemented product rather than a presentation-only concept. Its strongest asset is not an isolated marketplace screen; it is the linked commercial and operational record from product discovery through order, warehouse assignment, delivery, receiving variance, dispute, invoice, credit, and payment evidence. Web, Android, and iOS clients expose substantial role-specific workflows. Identity, tenant isolation, permissions, entitlements, audit, secure files, notification channels, and deployment infrastructure surround that core.

Supplify's product strategy has three layers:

1. **System of workflow:** daily purchasing and supplier fulfillment create recurring use.
2. **System of record:** immutable order snapshots, inventory movements, receiving, invoice and delivery evidence create trusted history.
3. **System of intelligence:** deterministic analysis and a tightly permissioned, read-only Scale assistant turn network data into reviewable decisions.

The current commercial model is subscription-led: Restaurant Growth/Intelligence/Scale at \$49/\$149/\$349 per month and Supplier Growth/Scale at \$149/\$349 per month, with two months effectively discounted on annual pricing. Usage limits, add-ons/overrides, premium placement and provider-backed charges create expansion surfaces. Transaction take-rate revenue is a strategic opportunity, not an established repository fact.

The principal investment case is a vertical operating network with two-sided retention: a restaurant benefits when more of its suppliers transact through the same workflow; a supplier benefits as more customers, catalog activity, orders, routes, and receivables consolidate. The main execution risks are commercialization and operations rather than absence of product breadth: external-provider configuration, finance reconciliation, mobile release validation, marketplace liquidity, support burden, documentation discipline, and careful control of scope.

2. The industry problem

Restaurants operate through fragmented truth

Restaurant procurement commonly spans calls, messaging threads, spreadsheets, supplier portals, paper delivery notes, and accounting follow-up. The operational consequences compound:

- buyers cannot easily compare the price they are actually entitled to pay;
- orders and amendments lose provenance;
- delivery location, cutoff, pack size, and minimum-order constraints create mistakes;
- receiving variance is discovered separately from the original order;
- inventory and recipe cost lag behind purchasing reality;
- invoice disputes depend on scattered photos and messages;
- multi-location operators lack a comparable view across branches.

Suppliers absorb the cost of fragmented demand

Suppliers face a mirror image: manually interpreted orders, customer-specific price complexity, stock uncertainty, pick/pack handoffs, dispatch coordination, driver status calls, incomplete proof, late receivables, and limited insight into demand. General-purpose commerce software often stops at checkout; warehouse or accounting systems may not carry the restaurant-side receiving and commercial context.

The information gap is the opportunity

Both sides need a shared, permissioned transaction history without surrendering their tenant boundaries. Supplify is designed to connect that history while preserving who owns the catalog, who placed the order, which operating entity and warehouse accepted it, what was delivered, what was received, and how the invoice was resolved.

3. Product thesis and value

The product thesis

The winning restaurant-supply network is not simply a product directory. It must reduce the labor and uncertainty of every repeat transaction. Once the same data supports purchasing, warehouse execution, proof, receiving, finance, and decision support, the platform becomes progressively more valuable and harder to replace.

Value to restaurants

Supplify can reduce ordering friction, surface effective price and availability, preserve accountability, accelerate receiving and disputes, improve stock/waste visibility, connect purchase cost to recipes, and bring invoices/statements into the same context. Multi-branch Scale views add organizational comparison without creating a retired central-approval product.

Value to suppliers

Supplify can consolidate demand, customer-specific pricing, warehouse work, dispatch, proof, exception handling, promotions, quotes, receivables, and demand signals. It gives commercial and operations teams a common order truth while keeping drivers in a restricted execution workspace.

Value to the network

Each completed transaction enriches a reusable operational graph: products, effective prices, demand, fulfillment outcomes, receiving variance, delivery reliability, and invoice behavior. The platform can improve decision support without selling an autonomous black box. This trust posture matters in businesses where an incorrect order or price has immediate physical and financial consequences.

4. Users and jobs to be done

User	Primary job	Supplyfy outcome
Restaurant owner	control purchasing, cost, cash exposure, and branches	common operational and financial view
Restaurant manager	keep daily supply and service operations moving	dashboard, orders, inventory, reservations, staff
Purchaser	source, compare, order, schedule, and resolve issues	catalog, effective price, cart, quick lists, quotes, disputes
Receiving staff	verify what physically arrived	line-level quantity/quality receipt and evidence
Restaurant accountant	understand payables, credits, and statements	invoice, payment record, aging and exports
Supplier owner/manager	grow accounts while controlling operations	customers, pricing, orders, fulfillment, receivables, intelligence
Warehouse manager	allocate stock and execute accurately	assignment, pick lists, packing, transfer and exceptions
Sales/catalog/promotions team	maintain offer and generate demand	products, contract pricing, quotes, deals, placement, loyalty
Supplier accountant	collect and reconcile	invoice, statement, aging, credit and recorded payment
Dispatcher	plan work and handle exceptions	command center, routes, run sheet, active map
Driver	execute today's assigned stops safely	restricted mobile stops, GPS, proof, problem reporting
Platform administrator	operate a safe multi-tenant service	tenant/subscription/admin/audit and incident controls

Role design is a commercial advantage as well as a security feature: the product can enter through a narrow job and expand across a company without giving every user owner-level access.

5. Product experience

Restaurant journey

1. Register, activate, select the correct restaurant workspace, and invite a role-based team.
2. Discover/follow suppliers and browse an eligible catalog with effective pricing.
3. Build a cart, select the delivery location, and place an idempotent order.
4. Track acknowledgment, processing, shipment, route, and delivery evidence.
5. Receive by quantity and quality; create a dispute when reality differs.
6. Update inventory/lots/waste and review invoice, credit, payment, and statement context.
7. Reuse quick lists, scheduled-order review, price history, recipe cost, reports, and advisory reorder/intelligence.

Supplier journey

1. Configure the supplier organization, operating tenant(s), warehouses, zones, team, and catalog.

2. Manage base and customer-specific pricing, relationships, quotes, deals, and loyalty.
3. Accept an incoming organization order into an eligible supplier tenant and warehouse.
4. Reserve stock, pick, pack, dispatch, build routes, assign drivers, and manage exceptions.
5. Capture delivery milestones/proof and respond to receiving variances/disputes.
6. Issue invoices, record payments/credits, monitor aging, and export financial data.
7. Use demand, stockout, warehouse, customer, and weekly intelligence to improve operations.

Driver journey

The driver sees assigned work, not the ERP. Today/run-sheet views lead into stop detail, navigation handoff, location sessions, pickup/out-for-delivery state, proof, and problem/reschedule handling. This focused design reduces training and limits access risk.

Platform journey

Administrators manage tenants, users, subscriptions/entitlements, feature controls, audits, and operating exceptions through a web-first control plane. Impersonation and sensitive actions are protected and recorded.

6. What is implemented today

Active transactional core

- multi-tenant Keycloak identity, workspace membership, role/permission enforcement, invitations, and audit;
- restaurant and supplier organizations, branches/locations, warehouses, customer relationships;
- supplier catalog, search, favorites/follows, effective pricing, contract pricing, RFQs, promotions, and loyalty;
- cart, server-side checkout, supplier-organization routing, one-warehouse allocation, immutable snapshots, stock reservation, idempotency, amendments, cancellations, and reorder;
- pick/pack/dispatch, transfers, routes/stops, drivers, GPS, proof, exceptions, and live/polling visibility;
- restaurant receiving, variance, lots/movements, waste, disputes, credits, and replacements;
- invoices, recorded payments, statements, aging, reminders, PDF and accounting CSV;
- chat, secure attachments, notification preferences, in-app/email/WhatsApp/push/webhook infrastructure;
- recipes/costing, reservations/waitlist/tables, staff/labour, reports, consumer ordering and loyalty;
- web plus substantial Android/iOS operational coverage.

Active intelligence

Deterministic price, purchasing, food-cost, waste, reliability, anomaly, reorder, demand, stockout, cross-sell, warehouse, and weekly views are implemented at tier-appropriate levels. Results are read-only and auditable back to source data.

The conversational assistant is active for eligible Restaurant Scale and Supplier Scale administrators when OpenAI is configured. It uses allow-listed read-only tools, per-user quota, an eight-tool loop cap, tenant/permission/feature checks, and cannot mutate orders, inventory, prices, deals, transfers, or communication. Drivers are excluded.

Active but externally configured

Email, WhatsApp, push, web push, S3-compatible storage, malware scanning, Redis distribution, Stripe/platform charges, OpenAI, custom domains, and mapping/navigation require environment secrets, provider approval, or release setup. Code presence is not conflated with a live provider in every deployment.

Partial, web-first, or bounded

- full administration, imports/organization controls, and richest command/intelligence screens are web-first;
- the finance ledger is implemented, but universal supplier settlement is not established;
- accounting is export-oriented, not confirmed live bidirectional synchronization;
- routing/ETA is operational, not advanced traffic-aware fleet optimization;
- reports are packaged analytics, not an arbitrary report builder;
- consumer ordering and staff/labour are narrower than the B2B core;
- background GPS, native push, deep links, and store builds require physical-device release testing.

Explicitly retired or not claimed

Central Purchasing and purchasing budgets/approvals are retired; legacy endpoints return 410 Gone . Supplify does not claim autonomous purchasing, live FX, driver AI access, arbitrary PDF intelligence, guaranteed supplier COGS-margin analysis, or automatic business changes from AI recommendations.

7. Business model and plan architecture

Subscription plans

Customer	Plan	Monthly	Annual	Product rationale
Restaurant	Growth	\$49	\$490	accessible core ERP plus basic intelligence/suggestions
Restaurant	Intelligence	\$149	\$1,490	advanced deterministic decision support for one location
Restaurant	Scale	\$349	\$3,490	multi-branch operating limits, Scale intelligence and read-only assistant
Supplier	Growth	\$149	\$1,490	core catalog, order, fulfillment, growth and finance operations
Supplier	Scale	\$349	\$3,490	multi-warehouse/advanced intelligence and read-only assistant

Annual prices represent approximately ten months at the monthly rate. Free trial/sandbox plans mirror Growth feature shape with lower meters and no assistant/AI platform. A legacy restaurant custom row remains inactive rather than being marketed as a current tier.

Why the packaging is coherent

Growth monetizes the daily system of workflow. Restaurant Intelligence creates a mid-tier for operators who need better decisions but not multi-branch/assistant capability. Scale monetizes organizational complexity, high usage, and the assistant. Supplier tiers reflect the higher operational value and breadth of fulfillment tooling. Entitlements and meters are enforced server-side, allowing pricing experiments without relying on hidden UI alone.

Revenue surfaces evidenced by the product

- recurring monthly/annual subscriptions;
- plan expansion as locations, warehouses, activity, storage, reports, and intelligence needs grow;
- add-ons/tenant overrides supported by the entitlement architecture;
- paid boosts/featured placement and promotion-related platform charges where provider configuration is live;

- negotiated enterprise services/custom configuration as a commercial possibility, although not a public active plan in the audited matrix.

Transaction commissions, financing, logistics brokerage, payments spread, data products, and supplier-funded marketplace programs may be future business opportunities. They should not be included in current revenue claims without contracts, compliance, and measured economics.

8. Platform economics and growth loops

Retention loop

Frequent orders create fulfillment and receiving history; history improves reordering and analysis; better workflow encourages more suppliers and staff to use the platform; more in-platform activity improves the shared record and switching cost. The retention mechanism is operational habit plus trusted data, not merely social engagement.

Supply and demand loop

Restaurant discovery and RFQs can expose demand to suppliers. Suppliers add richer catalog/pricing and improve fulfillment to win/retain accounts. Better availability, response, and reliability give restaurants more reason to consolidate transactions. Promotions, loyalty, referrals, sponsorship/placement, and supplier growth tools can accelerate the loop once liquidity is sufficient.

Expansion loop

A single-location restaurant can grow from transaction workflow to intelligence and then multi-branch Scale. A supplier can expand from core order fulfillment into warehouses, drivers, customer-specific pricing, finance, promotions, and Scale intelligence. Role-specific seats do not currently imply per-seat pricing in the audited matrix, but they increase organizational embedding.

Cost drivers

Primary variable/operating costs include cloud compute/database/storage, notification delivery, maps, malware scanning, push infrastructure, AI requests, support/onboarding, payment-provider fees, and reconciliation. AI has a hard per-user daily meter in the audited Scale plan. Read-only tooling and deterministic computation help keep expensive model usage focused.

Unit economics, CAC, retention, gross margin, marketplace GMV, and provider costs require live business data; none should be inferred from repository breadth.

9. Technology, data, and defensibility

Architecture built for a vertical operating network

The platform combines React/Vite web, React Native/Expo mobile, Node/Express services, PostgreSQL, Keycloak, Redis acceleration, Socket.IO realtime, private object storage, malware scanning, and provider adapters. Its domain schema spans commercial, fulfillment, receiving, finance, engagement, restaurant operations, and subscription control.

Defensibility thesis

Defensibility can emerge from four compounding assets:

1. **Workflow depth.** Replacing an order screen is easy; replacing connected pricing, warehouse execution, proof, receiving, dispute, and finance is harder.
2. **Relationship graph.** Organization/tenant/customer/product/price/warehouse/driver relationships encode how local food supply actually operates.
3. **Transaction provenance.** Immutable snapshots and event histories make analysis explainable and disputes resolvable.
4. **Role and entitlement infrastructure.** A centralized permissions/plan model lets the product expand safely inside customers and package differentiated value.

The code alone is not a moat. The durable moat depends on adoption density, clean data, operational reliability, customer trust, integration quality, and accumulated transaction history.

Responsible AI posture

Supplify uses deterministic logic when the answer should come from facts and rules, and an LLM only as a controlled explanatory/query layer. Assistant tools are allow-listed, read-only, tenant-scoped, permission-checked, and metered. This reduces automation risk and makes the feature commercially useful before autonomous procurement is appropriate.

10. Trust, control, and operating maturity

Trust architecture includes Keycloak identity, tenant isolation, system/custom roles, server-side entitlement enforcement, row locks and idempotency, exact-origin CSRF/CORS protections, structured redaction, audit/system events, private malware-scanned uploads, SSRF protection, verified webhooks, and production safeguards against stub payments or unsafe storage patterns.

The platform preserves distinctions that matter in diligence:

- a delivered order is not automatically accepted by receiving;
- a recorded payment is not automatically provider-confirmed settlement;
- a forecast is not an order;
- an AI answer is not a business mutation;
- a realtime event is not the durable source of truth;
- a legacy table is not an active product.

This conservative state model reduces hidden financial and operational ambiguity. Production maturity still requires disciplined secrets, backups/restores, monitoring, incident ownership, provider reconciliation, privacy operations, and real-device validation.

11. Readiness, constraints, and diligence questions

Product readiness

The B2B order-to-receive core, supplier fulfillment, role model, finance ledger, notifications, and cross-platform clients are implemented. The breadth supports controlled pilots and production deployments when the chosen integrations are configured and release gates are met.

Key execution risks

Risk	Why it matters	Mitigation visible in product / required next
Marketplace liquidity	two-sided value depends on local supply and demand density	lead with ERP value; focus geography/category; onboard existing relationships
Breadth and support	many modules can dilute quality and increase onboarding burden	role-based activation, analytics on use, disciplined tier/roadmap scope
Provider operations	email/push/WhatsApp/payments/AI may work differently by environment	readiness checks, provider reconciliation, tested fallbacks, explicit status
Financial expectations	ledger can be mistaken for money movement	clear UI/contracts, gateway state, reconciliation, regulated partner strategy if expanded
Mobile field reliability	GPS/push/background behavior varies by OS/device	physical-device test matrix, staged rollout, telemetry, polling fallback
Data quality	intelligence is only as strong as products, stock, receiving and pricing	validation, provenance, exception workflows, explainable deterministic logic
Multi-replica jobs	in-process schedulers require coordination	locks/idempotency, ownership/runbooks, monitoring; consider dedicated worker at scale
Security/privacy	multi-tenant commercial and location data is sensitive	layered controls plus independent testing, retention and incident operations
Historical documentation	old tier/feature claims can create sales/support errors	authoritative matrices, generated collateral, docs governance

Diligence questions management should answer with operating data

- How many active restaurant and supplier workspaces transact weekly, and in which markets/categories?
- What proportion of orders complete fully in-platform through receiving and invoice?
- What are logo and revenue retention by side/tier/cohort?
- Which workflows create activation and which modules are rarely used?
- What are gross margin and support/onboarding cost by tier?
- How much provider and AI cost is generated per active account?
- What is the rate of fulfillment exceptions, receiving disputes, late invoices, and resolved credits?
- Which launch integrations are configured in each environment, and when were restore/provider/device drills last passed?

12. Product-led roadmap opportunities

These are reasoned opportunities from the implemented foundation, not commitments:

Near-term commercialization

- focus onboarding around one complete order-to-receive path;
- instrument activation, first order, repeat order, supplier response, delivery proof, receiving completion, and invoice closure;
- build explicit provider/readiness dashboards and reconciliation runbooks;
- validate plan willingness-to-pay and limits with cohorts;
- complete physical-device, push, background-location, deep-link, and store-release matrices;
- consolidate current product truth so sales, support, web, native, and entitlements remain aligned.

Product depth

- deepen exception-first supplier command views and restaurant receiving resolution;
- add carefully selected accounting/ERP integrations through explicit supported contracts;
- improve routing only when reliable address/traffic/provider inputs justify stronger claims;
- expand packaged intelligence where data quality and customer decisions can be measured;
- add document extraction only with privacy, validation, provenance, and human review;
- move scheduled workload to a dedicated worker topology when scale/availability evidence warrants it.

Network and financial products

Supplier-funded demand generation, payments/settlement, credit, logistics coordination, benchmarking, and procurement network services may be high-value adjacencies. Each expands regulatory, liquidity, risk, support, and data-governance obligations. The recommended sequence is to prove transaction density and trusted operational records before adding capital-intensive or regulated layers.

13. Investment perspective

Why the opportunity is credible

- Restaurants and suppliers both have frequent, costly operational workflows.
- The product covers both sides plus the physical delivery role.
- The system captures structured truth after checkout, where many marketplaces stop.
- Subscription packaging aligns with operational complexity and decision value.
- Cross-platform workflow supports field use, not only office administration.
- Deterministic intelligence and controlled AI reuse the data asset without requiring risky autonomy.

What must be proven commercially

- a repeatable beachhead market and acquisition channel;
- supplier/restaurant activation with limited services burden;

- retention driven by complete workflows rather than feature breadth;
- pricing power and expansion from Growth to Intelligence/Scale;
- reliable field/provider operations at acceptable gross margin;
- measurable customer outcomes such as fewer errors, faster receiving, lower waste, improved fill rate, or faster collection.

Balanced conclusion

Supplify has the technical and product foundation of a vertical operating network: broad workflows, durable state, strong tenant/role controls, fulfillment depth, mobile execution, finance context, and a credible intelligence layer. Its next value inflection will come less from adding isolated features and more from proving density, activation, repeat use, provider reliability, and economic outcomes in a focused market. That is an execution challenge, but it is supported by substantially more implemented infrastructure than an early marketplace prototype.

14. Audited capability appendix

Capability	Customer value	Current status	Commercial caveat
Multi-tenant identity/RBAC	safe team adoption	Active	ongoing security/ops required
Catalog and discovery	consolidates sourcing	Active	value rises with local supply density
Contract/effective pricing	reduces pricing ambiguity	Active	no live FX
Checkout/idempotency/routing	reliable order capture	Active	one eligible warehouse per group; no silent split
Warehouse fulfillment	reduces execution gaps	Active	advanced optimization not claimed
Driver/GPS/POD	field visibility and evidence	Active	physical-device/release validation required
Receiving/inventory/waste	closes physical-truth gap	Active	depends on disciplined user capture
Invoice/credit/payment ledger	shared financial context	Active	universal PSP settlement not established
Quotes/promotions/loyalty	acquisition and retention	Active	paid placement/provider charges configuration-dependent
Chat/notifications	coordinated response	Active	external channels require credentials/approval
Recipes/reservations/staff/consumer	broader restaurant operating value	Active/bounded	not equivalent to best-of-breed depth in every category
Reports/deterministic intelligence	better operational decisions	Active	packaged, partly web-first
Smart reorder	faster reviewable purchasing	Active/advisory	never autonomous checkout
Scale assistant	conversational access to authorized facts	Active when configured	Scale admins only; read-only; metered
Android/iOS	in-field operational access	Substantial parity	admin/advanced views web-first; release credentials required
Central Purchasing/budgets/approvals	—	Retired	endpoints return 410; do not sell

15. Complete business capability map

Restaurant capabilities

Capability	What it does	Business value	Place in the workflow
Dashboard	Brings permitted orders, spend, stock, deliveries, reservations, usage, and actions into one view	Helps managers identify today's work quickly	daily operating entry point
Supplier discovery and profiles	Searches suppliers, product coverage, reputation, and public storefront information	Replaces fragmented contact lists and supports informed sourcing	before purchase and relationship building
Follow, block, connect, review, and chat	Maintains usable supplier relationships and communication history	Creates continuity while letting restaurants control unwanted relationships	sourcing, issue resolution, retention
Catalog and product search	Filters products by supplier/category/text and commercial context	Makes repeat sourcing faster and more transparent	product selection
Favorites and My Prices	Preserves frequently used products and negotiated/effective price context	Reduces repetitive search and price ambiguity	selection and repeat purchase
Price comparison	Compares conservatively matched products across followed suppliers	Supports an evidence-based buying decision without pretending unlike packs are equivalent	selection and intelligence
Cart and checkout	Validates quantities, pack rules, delivery location, effective price, and eligibility	Converts a mixed shopping task into durable supplier-group orders	transaction creation
Orders, calendar, tracking, and reorder	Preserves order history, status, amendments, delivery context, and repeat actions	Creates accountability and repeatability after checkout	order management
Quick lists and schedules	Saves repeat baskets and supports reviewed recurring ordering	Reduces effort for regular replenishment	repeat purchase
Quote requests	Requests line-level offers and locks a selected response to an order	Structures competitive sourcing and preserves commercial provenance	sourcing and order pricing
Receiving and quality	Records actual quantity, quality, lot/expiry, evidence, and variance	Connects physical reality to stock, dispute, and invoice outcomes	post-delivery reconciliation
Inventory, lots, expiry, and waste	Maintains movements, on-hand/par/reorder data, expiry and waste records	Supports availability, traceability, and loss awareness	operations and replenishment
Disputes and credits	Turns shortages/damage/wrong items into a tracked resolution	Reduces dependence on informal messages and preserves remedy history	exception and financial resolution
Invoices, payments, and statements	Presents payable, balance, credit, aging, and recorded-payment context	Gives the restaurant one commercial history linked to the order	financial follow-through
Recipes and costing	Maps ingredients to recipes and current cost/profitability signals	Connects procurement changes to menu economics	cost control and analysis

Capability	What it does	Business value	Place in the workflow
Reservations and guests	Manages tables, availability, bookings, waitlist, offers, and guest communication	Broadens restaurant operating value beyond purchasing	front-of-house operations
Staff and labour	Manages staff records, schedules, time, leave, swaps, documents, incidents, and export	Consolidates daily workforce coordination	restaurant operations
Consumer menu, ordering, and loyalty	Supports the restaurant's direct guest menu/order/member context	Connects selected consumer operations without exposing the ERP	guest commerce
Reports and deterministic intelligence	Packages spend, price, waste, reliability, anomaly, recipe, and branch signals	Helps managers act on history without an opaque autonomous system	analysis and planning
Smart reorder	Produces a reviewable suggestion/forecast with commercial constraints	Speeds replenishment decisions while keeping a human in control	planning to cart
Scale assistant	Answers authorized questions through read-only tools	Makes complex operational data easier for eligible administrators to explore	analysis only

Supplier capabilities

Capability	What it does	Business value	Place in the workflow
Dashboard, command center, and run sheet	Consolidates demand, fulfillment, routes, exceptions, inventory, and receivables	Focuses teams on work that can delay an order or collection	daily operating entry point
Organization and tenant structure	Groups sellable supplier accounts while retaining tenant ownership	Supports expansion without blurring legal/operational boundaries	account architecture
Catalog and products	Maintains product, pack, category, image, availability, and operating data	Creates a reusable digital offer for multiple customers	demand generation and ordering
Base and contract pricing	Applies general and restaurant-specific commercial terms	Preserves customer relationships and reduces manual price interpretation	before and during order
Customer relationships and growth	Manages connections, account activity, referrals, sponsorship, and placement surfaces	Helps acquire and retain restaurant demand	commercial growth
Incoming order control	Reviews, acknowledges, processes, cancels, amends, and traces orders	Replaces scattered order intake with an accountable queue	order intake
Warehouse inventory and routing rules	Tracks stock and determines eligible fulfillment location	Prevents allocation to an invalid branch or warehouse	validation and allocation
Pick, pack, dispatch, and transfer	Converts an accepted order into controlled warehouse work	Reduces handoff ambiguity and records exceptions	physical fulfillment
Routes, stops, and drivers	Builds delivery work and assigns accountable drivers	Coordinates last-mile execution from the same order record	dispatch and delivery

Capability	What it does	Business value	Place in the workflow
GPS, proof, and exceptions	Adds location freshness, milestones, evidence, failure, retry, and reschedule context	Reduces status calls and strengthens delivery accountability	delivery execution
Quotes	Receives requests and returns price, availability, note, and expiry	Creates a structured sales channel linked to an eventual order	pre-order sales
Promotions, placement, and loyalty	Creates targeted offers and retention incentives with review and usage tracking	Supports measurable demand generation	acquisition and repeat purchase
Invoices, receivables, statements, and credits	Manages amounts due, recorded payments, aging, reminders, and remedies	Connects operations to collection	financial follow-through
Reports and Scale intelligence	Analyzes product/customer/fulfillment/finance plus demand, stockout, cross-sell, deal, and warehouse signals	Supports decisions about stock, service, and growth	planning and management
Scale assistant	Provides a read-only conversational view for eligible administrators	Lowers the effort of querying operational information	analysis only
Team, roles, settings, and audit	Separates owner, warehouse, fulfillment, driver, catalog, promotion, and finance responsibilities	Enables adoption across departments without universal access	governance

Driver capabilities

Capability	What it does	Business value	Place in the workflow
Restricted access	Shows only work tied to an active linked driver profile	Protects supplier and customer information	sign-in and every request
Today view and run sheet	Organizes assigned routes/stops	Gives the driver a clear work queue	start of shift and between stops
Stop detail and navigation handoff	Shows destination, instructions, contact context, and navigation	Reduces dispatch calls and address mistakes	travel to stop
Pickup and delivery milestones	Records progress through controlled states	Gives the supplier and restaurant a shared operational timeline	physical execution
GPS and heartbeat	Sends session-bound foreground location/freshness	Supports practical visibility without replacing durable state	active delivery
Proof of delivery	Associates required evidence with the exact assignment/leg	Strengthens accountability and later dispute evidence	at delivery
Problem, failure, retry, and reschedule	Records why work could not complete and what happens next	Prevents operational exceptions from disappearing into phone calls	exception handling
Notifications	Surfaces assigned operational milestones in-app	Keeps attention on relevant work without noisy commercial messages	throughout execution

One transaction, end to end

The commercial promise is captured at placement; the physical promise is executed in fulfillment and delivery; the acceptance truth is captured by receiving; and the financial truth continues through invoice, credit, payment, and statement. Keeping these truths linked but separate is central to the product's accountability.

Multi-branch and multi-warehouse scale

Restaurant organizations can group operating accounts and locations so larger customers gain comparable reporting and controlled access while orders retain an explicit delivery location. Supplier organizations can group sellable supplier tenants, each of which owns products, customers, staff, and warehouses. New-order routing can choose an eligible child supplier tenant and one warehouse for the complete supplier basket; it does not silently split one basket. A later transfer remains inside the same supplier tenant.

Commercially, this supports growth from one operating site to a network without turning the product into a centralized approval/budget system that no longer exists. Scale value comes from visibility, consistent controls, and multi-location intelligence—not from a claim that every local decision is centralized.

Product footprint

Surface	Designed for	Relative breadth
ERP/web	owners, managers, purchasing, finance, warehouse, dispatch, support, and platform administration	broadest management, configuration, reporting, intelligence, and admin surface
Restaurant mobile	purchasing, tracking, receiving, inventory/waste, finance review, restaurant operations, chat, and notifications	substantial day-to-day operational coverage
Supplier mobile	orders, fulfillment, run sheet/map, products/prices, customers, promotions, receivables, intelligence, and chat	substantial operational and commercial coverage
Driver mobile	today's assignments, stop execution, GPS, proof, and exception reporting	intentionally narrow and role-restricted

Product truth note

Current enforced product behavior takes precedence over outdated material. The audit did not count a capability merely because an internal component exists or a screen is visible; it required evidence that the workflow and its access controls are genuinely connected. The companion *Supplify Complete Product & Technical Guide* contains the deeper workflow, architecture, RBAC, security, data, lifecycle, and evidence audit.

End of confidential discussion document.
