

SUPPLIFY

STAKEHOLDER OVERVIEW

Stop running F&B supply across chats, sheets, and guesswork.

Supplify is the connected operating platform for procurement and supply—one shared workflow from discovery and pricing through fulfillment, delivery, receiving, and financial control.

Built for restaurant teams and suppliers who need execution depth—not another catalog inbox.

September 2026

Product-ready platform • Pilot-ready conversation

Every order still dies in a group chat

Buying may start digitally—but price, stock, delivery, and payment truth scatter the moment the work begins.

THE REAL COST

**Your team reconstructs
yesterday instead of
controlling tomorrow.**

ONE ORDER • MANY VERSIONS OF TRUTH

One order. One timeline. One source of truth.

A marketplace at the front—with the operational depth to finish the job after checkout.

One ecosystem, role-aware experiences

Each actor sees the workflow they need; the platform keeps the shared commercial and operational context connected.

Give restaurant teams control—not another shopping cart

Source, buy, receive, and manage with branch-aware visibility and a shared transaction history.

SOURCE

Suppliers, catalogs, deals, and RFQs

PURCHASE

Contract pricing, quotes, cart, and quick lists

TRACK

Order status, delivery progress, and exceptions

RECEIVE

Accepted quantities, discrepancies, and disputes

CONTROL

Inventory, invoices, costs, staff, and reporting

WHY IT WINS

Purchasing, receiving, stock, and payables stay connected—so the branch never rebuilds the story after delivery.

Turn every order into an executable operating plan

Sell with customer-specific terms, then coordinate warehouse, delivery, receivables, and growth.

SELL

Catalogs, customer pricing, quotes, and promotions

FULFILL

Acknowledge, reserve, pick, pack, and assign

DELIVER

Routes, drivers, live status, and proof

MANAGE

Inventory, disputes, invoices, and receivables

GROW

Customer acquisition and operational intelligence

INCOMING ORDER → OPERATIONAL QUEUE → PROOF → RECEIVABLE

One order lifecycle—five moments of control

Commercial intent, physical execution, acceptance, and financial closure remain connected—but distinct.

DELIVERED ≠ RECEIVED ≠ INVOICED ≠ PAID

Clarity buyers and suppliers can trust.

Built for organizations—not isolated locations

Commercial visibility rolls up while execution stays attached to the branch, tenant, and warehouse that own it.

RESTAURANT SIDE

Central visibility
Branch delivery context
Branch stock & receiving

THE RULE

**Visibility rolls up.
Operational ownership
stays explicit.**

NO ARBITRARY CROSS-TENANT FULFILLMENT

SUPPLIER SIDE

Customer sees the organization.
Stock and fulfillment retain explicit ownership.

Pricing follows the relationship—then becomes immutable

Applicable terms are resolved at checkout and the result is snapshotted onto the order.

The marketplace continues into the warehouse and onto the road

The order remains connected while each role works from its own queue and permissions.

ROUTING BOUNDARY Each new basket is fulfilled by one compatible supplier tenant and one warehouse; it is not silently split across operators.

The order becomes an operating data flywheel

Accepted supply activity feeds the modules that help restaurants control stock, cost, people, and service.

Implemented as product modules; several cross-module automation loops remain partial.

A B2B core—with optional public demand channels

Selected catalog and ordering experiences can be exposed publicly without replacing the operating system behind them.

Restaurant consumer ordering

Intelligence that explains the operation before it automates it

Deterministic services calculate; the assistant reads and explains within the user's permissions and plan.

WHAT IT DOES TODAY

- 1 Read-only assistant** Answers from live, tenant-scoped operational data.
- 2 Operational intelligence** Demand, expiry, waste, stockout, customer, and warehouse signals.
- 3 Reorder assistance** Deterministic baseline; AI explanation when entitled.
- 4 Human review** Recommendations remain reviewable before action.

GUARDRAILS

The assistant does not...

- ✗ Place or approve an order
- ✗ Change stock or pricing
- ✗ Assign a driver or route
- ✗ Bypass tenant permissions
- ✗ Present heuristic fallback as AI

Availability is gated by tenant type, plan, feature flags, permissions, provider configuration, and quota.

Events become coordinated action—not more noise

A single event can fan out by actor, preference, feature entitlement, and channel configuration.

Some delivery milestones intentionally remain in-app only.

Trust is designed into the operating layer

Controls protect tenant boundaries, privileged actions, documents, identities, and the historical record.

01

Tenant isolation

Business data is scoped to the organization and server-resolved context.

02

Roles & permissions

RBAC, feature entitlements, and plan limits shape every experience.

03

Identity

Keycloak-backed sessions and guarded role-aware routes.

04

Private files

Signed access, validation, quarantine, and malware scanning when configured.

05

Auditability

Commercial, admin, security, and status actions retain history.

06

Admin safeguards

Time-limited impersonation blocks sensitive mutations.

Application controls, platform configuration, and deployment operations work together.

One platform, multiple role-aware surfaces

Channel-specific experiences sit on shared domain services, controls, and infrastructure.

Where others stop at “order placed,” Supplify keeps going

A marketplace helps two parties meet. An operating platform helps them execute, reconcile, and improve together.

TYPICAL MARKETPLACE

VALUE STOPS AT THE HANDOFF

SUPPLIFY

VALUE COMPOUNDS AFTER THE ORDER

Subscriptions scale with operating complexity

A 30-day trial leads into tenant-specific plans. Prices shown are the current configured public catalog.

BILLING

Manual/stub capable; live recurring PSP integration remains external work

Ready enough to win—honest about what comes next

The end-to-end workflow exists today. Next work hardens production connections and closes the highest-value loops.

NOW

Ship & demo

- B2B ordering, pricing & quotes
- Fulfillment, routes, drivers & POD
- Receiving, disputes & finance
- Multi-branch / warehouse foundations
- Role-aware web + mobile
- Read-only operational intelligence

NEXT

Harden & connect

- Production deployment configuration
- Channel provider credentials
- Live recurring billing integration
- Finance reconciliation workflows
- Canonical timeline polish
- Cross-module operating loops

LATER

Expand the moat

- Closed-loop replenishment
- Human-approved action-taking AI
- Full central purchasing
- PSP & accounting reconciliation
- Road / capacity optimization
- Deeper ecosystem integrations

Let's put one connected operating layer under your F&B supply.
